it has been obvious to those of us in behavioral analysis that many of the problems of business and industry could be analyzed in terms of the management of behavior what was needed was the use of a knowledge of behavior analysis to

develop effective personnel incentive systems not only was obvious to Dale and Karen Brethower but they and some of their colleagues have actually been doing it for the last few years. The results of their work are presented in this text. It should be emphasized that the approach presented in this book is a general one; it is just as applicable to the management of behavior in education, health, and government institutions etc. as in business and industry. A total performance system is a functional combination of systems analysis and feedback systems like behavioral analysis. The total performance system approach has an extremely wide range of applications both within and outside the areas of business and industry.

This book presents a fascinating and self-contained account of recruitment learning, a model and theory of fast learning in the neocortex in contrast to the more common attractor network paradigm for long and short term memory recruitment. Learning focuses on one-shot learning or chunking of arbitrary feature conjunctions that co-occur in single presentations. The book starts with a comprehensive review of the historic background of recruitment learning, putting special emphasis on the ground-breaking work of Donald Hebb, Walter A. Wickelmaier, Jerome A. Feldman, Lloyd G. Valiant, and Ishwari. Afterwards, a thorough mathematical analysis of the model is presented which shows that recruitment is indeed a plausible mechanism of memory formation in the neocortex. A third part extends the main concepts towards state-of-the-art spiking neuron models and dynamic synchronization as a tentative solution of the binding problem. The book further discusses the possible role of adult neurogenesis for recruitment. These recent developments put the theory of recruitment learning at the forefront of research on biologically inspired memory models and make the book an important and timely contribution to the field.
